

Jarvis Dashboard Runtime And Delivery Closeout

Date: 2026-07-10

Executive Result

The ArchFlow Jarvis dashboard has been refreshed from the latest public repository state and corrected so it no longer presents a historical Railway deployment as continuous always-online proof. Local dashboard generation, provider-disabled Jarvis behavior, browser-local persistence, desktop/mobile layout, accessibility basics, and public-safety checks pass.

Current hosted checks also return HTTP 200 for the Vercel and Railway health, chat, PRD/ICP, and agent-orchestra review-packet routes. Provider calls and external writeback remain zero. These are current point-in-time health checks, not continuous monitoring or durable writeback proof.

Dashboard Corrections

- Removed the unsupported always_on Railway label from generated dashboard data.
- Separated implementation-contract presence from current hosted-health proof.
- Classified Railway as a historical provider-disabled baseline that requires a live check.
- Regenerated the dashboard from the latest plans, reports, runs, decisions, issues, and WikiLLM state.
- Added an inline favicon to eliminate the only browser console 404.
- Added an explicit accessible name to the Jarvis message field.
- Made the screenshot smoke portable for temporary output without storing local absolute paths.

Runtime Verification

Surface	Check	Result	Boundary
Local dashboard	Eight rendered routes	Pass	Static/read-only surface
Local Jarvis	Health and chat through temporary loopback service	HTTP 200	Provider disabled; writeback disabled
Local API contract	Seventeen endpoints	Pass	Provider calls 0; writeback 0
Vercel Jarvis	Health, chat, PRD/ICP, agent orchestra	HTTP 200	Review packets only; provider calls 0; writeback 0
Railway Jarvis	Health, chat, PRD/ICP, agent orchestra	HTTP 200	Review packets only; provider calls 0; writeback 0
Browser persistence	Chat/config across reload	Pass	Browser localStorage only
Session packets	Same-tab reload	Pass	Browser sessionStorage only
Desktop/mobile	Overflow and core controls	Pass	No horizontal overflow
Browser diagnostics	Console, page, request failures	Pass	No remaining errors

Saving Matrix

State	Proven	Not proven
Browser chat/config	Saved locally across reload until explicit clear	Cross-device or server persistence
Browser packets	Saved for the current browser session and exportable	Automatic durable ingestion

State	Proven	Not proven
Public artifacts	Saved through reviewed Git commits	Autonomous Git writeback
Dashboard snapshot	Generated and deployable from public files	Live observation of local file changes
External systems	Provider-disabled review packets return successfully	Notion/database persistence, auth-backed client storage, autonomous writeback

Quality Review

- Desktop and 390-pixel mobile layouts render without horizontal overflow.
- Visible buttons and inputs have accessible names.
- No duplicate element identifiers were detected.
- The main and navigation landmarks are present.
- Browser-local chat survives reload and is cleaned after the test.
- The dashboard remains intentionally information-dense; no broad redesign was justified by the current evidence.

PDF And Telegram Delivery

A bounded inventory covers PDFs generated on or after 2026-07-04. Public Git reports use stable repository links. The broader planning-package reports are not copied into the public repository and are not transmitted by the approved public-repository sender. Their local-only status is listed without exposing private paths.

Telegram sender and private-target preflight passed without storing or exposing credentials, target identifiers, names, or response bodies. Only reviewed public-repository artifacts may be sent. Final delivery status is recorded in the companion run artifacts.

Deployment And Delivery Result

- The reviewed source and four public PDF reports were pushed to main.
- A production Vercel build completed successfully from the linked public project.
- The canonical ArchFlow dashboard alias was moved from the July 3 deployment to the verified July 10 deployment with the prior deployment retained as rollback evidence.
- The live dashboard serves the July 10 generated snapshot, corrected Jarvis status, and current closeout artifact.
- Canonical dashboard, API health, hosted closeout PDF, and all four public Git PDF links return HTTP 200.
- Hosted Playwright passes reload persistence, desktop/mobile layout, accessibility basics, and zero console/page/request failures.
- Telegram message plus four public-safe PDF documents were sent successfully through the approved sender to the verified private target.
- The six broader planning-package PDFs remain local-only and were not transmitted.

Remaining Gaps

- Provider execution remains disabled and was not needed for this closeout.
- Durable external writeback, client workspaces, auth-backed storage, and cross-device persistence are not implemented.
- A current successful health check is not continuous monitoring or an uptime guarantee.

- Six broader planning-package PDFs have no stable public links and remain outside the approved publication and Telegram file-sender boundary.
