

Agent Handout: Claude Code Continuation And Stabilization

Date: 2026-07-03

Status: complete and sent through approved Telegram sender

Lane: Claude Code handoff, full-system review, stabilization plan, Telegram file delivery

Title And Purpose

This handout is for Claude Code or any next local agent continuing ArchFlow. It summarizes the current system, the company goal, the reliable architecture, the best next tasks, and the exact rules for using the knowledge base, second-brain layers, LlamaIndex, dashboard, Notion, Telegram, and OpenRouter.

Human Summary

ArchFlow is no longer just a project reset. It has a working public-safe proof stack: Codex-operated repo, WikiLLM durable memory, live communication log, LlamaIndex bounded hybrid retrieval, LangGraph/CrewAI contracts, static/browser-local dashboard, and hosted provider-disabled Jarvis review-packet endpoints. The website now communicates the B2B SaaS product-team PRD/ICP service direction.

The project is not yet a fully autonomous runtime. Railway, provider-backed Jarvis, dashboard-driven writeback, raw voice storage, full vector defaulting, live Nexus writeback, and payment-test validation remain gated. The next agent must not overclaim them.

The highest-leverage continuation is not adding another architecture. It is stabilizing the current one and moving into the first commercial-learning sequence: E1.4 KB update principle, E2.0A PRD-to-ICP dry run, E3.1 positioning lock, E4.1 content calendar, and Telegram task cleanup.

Current State

FACT:

- main is the current pushed branch for public-safe source state.
- E1.1 is Done.
- E1.2 is Review pending owner acceptance.
- LlamaIndex hybrid fallback benchmark passes.
- Dashboard static smoke passes.
- Hosted Vercel Jarvis review-packet endpoints respond.
- Telegram file delivery now has a script and audit path.
- Daily Founder Notes were filled for 2026-06-24 through 2026-07-03.

INTERPRETATION:

- The system is reliable enough for E1.4 and E2.0A.
- It is not reliable enough for autonomous provider, writeback, voice, or Railway claims.

GAP:

- E1.4, E2.0A, E3.1, E4.1, and TG task cleanup remain unfinished.
- Provider activation needs a separate approved lane with ledger and budget guard.

Agent Continuation Prompt

Use `project/runs/2026-07-03-claude-continuation-stabilization/claude-code-continuation-prompt.md`.

Execution Trace

FACT:

- Read operating rules, live communication files, project plan, agent stack, model routing, agent roster, dashboard/website files, Notion task schema, Notion task rows, previous current-state report, and hybrid RAG handout.
- Ran local full-check stack and hosted endpoint smoke.
- Created system review, OpenRouter routing plan, PRD/ICP template, agent execution template, and Claude continuation prompt.
- Added a reusable Telegram document sender.

INTERPRETATION:

- Current docs and checks support a handoff to Claude Code without requiring chat history.
- The next agent has enough structure to execute the next stage safely.

Decisions

- Do not mutate Notion task statuses in this run; write analysis and handoff instead.
- Do not replace `model-routing.yaml` yet; provider routing remains a disabled policy contract until an approved provider activation lane begins.
- Treat Telegram file delivery as proven only for sanitized files through approved sender env, not as autonomous public-project Telegram automation.
- Keep the dashboard as a command/control surface, not the primary brain.

Artifacts

Artifact	Purpose
<code>project/scripts/send-telegram-files.py</code>	Reusable public-safe Telegram document sender.
<code>project/runs/2026-07-03-claude-continuation-stabilization/project-checkup-evidence.md</code>	Full checkup evidence.
<code>project/runs/2026-07-03-claude-continuation-stabilization/system-review-stabilization-plan.md</code>	Deep review and stabilization plan.
<code>project/runs/2026-07-03-claude-continuation-stabilization/system-review-stabilization-plan.pdf</code>	Sendable PDF version of the stabilization plan.
<code>project/runs/2026-07-03-claude-continuation-stabilization/openrouter-model-routing-optimization.md</code>	Provider-routing recommendation.
<code>project/runs/2026-07-03-claude-continuation-stabilization/templates/prd-icp-service-template.md</code>	Architecture 1 template.
<code>project/runs/2026-07-03-claude-continuation-stabilization/templates/agent-execution-template.md</code>	Architecture 2 template.
<code>project/runs/2026-07-03-claude-continuation-stabilization/claude-code-continuation-prompt.md</code>	Copy-ready Claude Code prompt.
<code>project/runs/2026-07-03-claude-continuation-stabilization/claude-code-continuation-prompt.pdf</code>	Sendable PDF version of the prompt.

Artifact	Purpose
project/runs/2026-07-03-claude-continuation-stabilization/telegram-file-delivery-status.md	Sanitized delivery proof for Telegram files.

Validation

Passed before artifact creation:

- public safety scan;
- workflow validation;
- pre-push runtime guard;
- LlamaIndex smoke;
- LlamaIndex benchmark;
- dashboard static smoke after loopback permission;
- JavaScript syntax check;
- Python syntax check;
- dashboard JSON parse;
- hosted /health;
- hosted dashboard HTML;
- hosted dashboard data route;
- hosted PRD/ICP lane;
- hosted agent-orchestra lane;
- hosted chat review packet.

Passed after artifact creation:

- regenerated dashboard data;
- public safety scan;
- workflow validation;
- runtime guard;
- LlamaIndex smoke;
- LlamaIndex benchmark;
- dashboard static smoke after loopback permission;
- dashboard JSON parse;
- Python syntax check for the Telegram file sender and Jarvis API files;
- JavaScript syntax check;
- `git diff --check`;
- Telegram file delivery with sanitized status only;
- first commit and push for the handoff packet.

Next Actions

1. Complete E1.4 KB update principle.

2. Run E2.0A PRD-to-ICP dry-run packet.
3. Lock E3.1 positioning.
4. Complete E4.1 five-week content plan.
5. Review TG-1/TG-2/TG-3 against the new Telegram sender and delivery audit.

Safety Boundary

Do not ingest private files, raw transcripts, raw voice/audio, private Notion pages, screenshots, account IDs, credentials, or local absolute paths. Do not call providers, deploy Railway, promote production, write to Notion/GitHub/WikiLLM from the dashboard, or send Telegram messages unless the exact approval path and public-safe template are clear.
