

E1.2.8 Source Methodology Review

Status: methodology applied to local/Codex PRD run

Method Inputs

The discovery-methodology document supports the following operating principles:

- Use Jobs-to-Be-Done framing: focus on the progress the user is trying to make.
- Prefer recent behavioral evidence, especially decisions made in the last 90 days.
- Ask for concrete past stories instead of hypothetical purchase intent.
- Separate goals from measurable requirements and define Definition of Done clearly.
- Use interview evidence and source labels to support PRD claims.
- Run Discovery and Delivery as parallel tracks: evidence before build, implementation after validation.
- Treat the PRD as a living contract that feeds task systems and engineering handoff.

How The Method Was Applied

Method	Application In This Run	Output
JTBD	Treated the meeting as evidence of the product team's job: convert discussion and discovery into delivery-ready work	PRD problem and pains
90-day / recent behavior rule	Kept future validation focused on recent product-team behavior rather than abstract preference	E2/E6 validation gap
Story-based discovery	Interpreted meeting topics as concrete process stories, not wishlist features	Context digest
Evidence-backed PRD	Marked unsupported claims as gaps and kept public output source-labeled	PRD decisions and risks
Measurable requirements	Converted vague improvement themes into acceptance criteria and Definition of Done candidates	Requirements table
Dual-Track Agile	Separated discovery sprint, customer interviews, and delivery-ready work	Backlog

Strategic Fit

The method fits ArchFlow's customer because B2B SaaS product leaders need a system that preserves discovery context, translates it into product requirements, and keeps delivery handoff controlled. The run reflects the service promise: raw product material becomes a source-backed PRD, task matrix, evidence gaps, and review packet.

Remaining Method Gaps

- The source is internal product-organization material, not buyer validation.
- The output needs owner review before it becomes the accepted E1.2 artifact.
- OpenRouter comparison should test formatting/quality differences only after sanitized-provider gates pass.
