

ArchFlow Current State Report

Prepared: 2026-07-03

Scope: public-safe founder briefing, current architecture, knowledge-system methodology, proof evidence, and next transfer state.

Executive Summary

ArchFlow is now organized around a single reliable operating path:

```
approved source material
-> source boundary review
-> structured context
-> PRD and ICP output
-> task and responsibility plan
-> knowledge-base update
-> review gate
-> optional external action only after approval
```

The project has moved from a reset and documentation state into a working proof system. The current reliable surface is static/browser-local dashboard plus provider-disabled Jarvis review packets, Codex-operated execution, WikiLLM durable memory, Graphify structural reference, bounded LlamaIndex retrieval, LangGraph routing, CrewAI role structure, and public-safe Notion/Git reporting.

The system is not yet a fully autonomous production runtime. Provider-backed Jarvis generation, Railway always-on workers, dashboard-driven writeback, full vector defaulting, raw voice storage, live Nexus actions, broad external repo ingestion, and autonomous Notion/GitHub/Telegram updates remain gated.

What Changed Since The Reset

Reset Direction

The 2026-06-24 reset narrowed the company operating focus to the internal proof loop: dialogue, chat, meeting notes, or planning material into PRD, tasks, responsibility map, and agent-ready knowledge base. Older STR and finance automation tracks remain useful history, but they do not define the current company-level plan.

Public-Safe Repo Foundation

The public project now has:

- English-only public-safe operating rules.
- Sanitized project plan and history.
- WikiLLM memory, insights, runs, and logs.
- Workflow contracts for LangGraph, LlamaIndex, CrewAI, knowledge integration, and market research.
- Runtime guard scripts and public-safety scan.
- Local dashboard data generation.
- Run handouts for continuation without chat history.
- Live communication log for active multi-agent coordination.

Product Direction

The current first ICP is product teams inside B2B SaaS scaleups. The first offer is a Product Discovery-to-Production PRD Pack: turn messy discovery, meetings, and product-team source material into reviewed PRD/ICP/task artifacts with evidence boundaries and review gates.

Current Architecture

Codex

Role: primary local operator, editor, verifier, approval boundary, and closeout owner.

Current state:

- Active and reliable for repo edits, proof runs, Notion connector updates, Git commits, and public-safety review.
- Must stay responsible for final promotion decisions before external writes.

WikiLLM

Role: durable curated memory and human/agent knowledge source of truth.

Current state:

- Stores run notes, log entries, memory candidates, insights, issues, and decisions.
- Prevents repeated failure by preserving proof chains and corrected assumptions.
- Should not be replaced by LlamaIndex, Graphify, Cognee, turbovec, or dashboard local storage.

Graphify

Role: generated structural reference for code, docs, and architecture relationships.

Current state:

- Output exists for the public repo and is used as structural reference.
- Generated graphs are not final human synthesis.
- Human conclusions must be written back into WikiLLM, decisions, issues, or run notes.

LlamaIndex

Role: bounded retrieval layer over approved public corpus.

Current state:

- Approved corpus: project/, history/, skills/, and wiki/.
- Retrieval mode: bounded hybrid retrieval with lexical fallback.
- Metadata: source path, document type, updated time, document ID, and chunk ID.
- Safety: refuses private-source matches by default and requires source paths in output.
- Benchmark: 20-query retrieval benchmark passed with lexical recall and hybrid recall at 20 out of 20 in fallback mode.

Limit:

- The local embedding endpoint was not reachable, so vector execution fell back to lexical retrieval. Full vector defaulting remains blocked until vector availability and benchmark pass together.

LangGraph

Role: state controller, routing layer, and review-gate path.

Current state:

- Sanitized smoke workflow passed.
- E1.2 deterministic proof rerun passed with approved final state and stream events.
- Target role: control source boundaries, task sequence, review gates, and stop conditions.

CrewAI

Role: named role structure and future direct task execution.

Current state:

- Config/import checks pass.
- Level 3 proof passed on a deterministic local fixture with zero provider calls and zero spend.
- Not default runtime yet.

Jarvis Dashboard

Role: communication and control surface.

Current state:

- Static/browser-local dashboard is active.
- Local Jarvis API and hosted provider-disabled Vercel endpoints return review packets.
- Header shows connected/disconnected API state.
- Direct buttons 1 and 2 select the two modes:
 - 1: PRD/ICP service output path.
 - 2: agent orchestration and architecture work path.
- Chat history and packets are staging surfaces, not durable memory until reviewed.

Limit:

- Provider-backed generation, writeback, raw voice storage, and autonomous external updates are disabled.

Notion

Role: task board and founder-note publishing surface.

Current state:

- Append-only task evidence updates are used.
- Daily Founder Notes entries were prepared day by day from project evidence.
- Broad Notion rewrites and Done-state promotions remain avoided unless evidence and owner acceptance are clear.

Telegram

Role: private short-status delivery only when an approved sender path exists.

Current state:

- Earlier sends were skipped when no approved sender was available.
- A later sanitized message succeeded through the approved Telegram API path.
- Tokens, chat IDs, destinations, and response bodies are not stored in public files.

Traceback gain:

- A Telegram-token-shaped value was removed from tracked documentation after the knowledge-base and safety flow surfaced it. The correction is a concrete example of why the knowledge base is operationally useful.

Current Proof State

Passed Or Working

- Public project reset and sanitized history.
- Local Ollama/Qwythos generation.
- LangGraph smoke and E1.2 proof.
- LlamaIndex approved-corpus retrieval and hybrid fallback benchmark.
- CrewAI config/import validation.
- CrewAI deterministic local Level 3 proof.
- Public-safety scan discipline.
- Dashboard static smoke testing.
- Local and hosted provider-disabled Jarvis review-packet endpoints.
- Append-only Notion connector updates.
- Sanitized Telegram delivery through approved sender path.
- Git main push for the hybrid RAG and Jarvis readiness work.

Gated

- Railway always-on Jarvis runtime.
- Provider-backed Jarvis generation.
- Full vector defaulting and turbovec.
- Dashboard-driven Notion/GitHub/WikiLLM writeback.
- Raw voice/audio storage.
- Live Nexus write actions.
- Broad external GitHub repo ingestion.
- Production promotion and Figma sync except when explicitly requested.
- Autonomous Telegram automation.

Methodology

Evidence First

Every claim should map to one of:

- a repo file;
- a run handout;
- a WikiLLM run note;
- a workflow validation result;
- a dashboard smoke result;
- a Notion connector update;
- a sent or skipped Telegram status artifact.

FACT / INTERPRETATION / HYPOTHESIS / GAP

The project uses this structure for meaningful decisions:

- **FACT:** what is proven by local state or connector output.
- **INTERPRETATION:** what the facts mean for architecture or operations.
- **HYPOTHESIS:** what may be true but still needs proof.
- **GAP:** what remains unproven, blocked, or approval-gated.

Source Boundaries

Sources are routed as:

- approved public file;
- sanitized summary;
- private source for local reasoning only;
- blocked source.

The default rule is no raw private ingestion and no secrets in public files.

Token Economy

The knowledge system avoids broad context dumps:

- read routing files first;
- use WikiLLM and run handouts before broad repo reads;
- use Graphify for structure when available;
- use LlamaIndex for approved retrieval;
- write detailed durable output into files instead of chat;
- keep chat final answers short.

Current Daily Founder Notes Coverage

The Daily Founder Notes sequence now covers:

- 2026-06-24 reset direction.
- 2026-06-25 public-safe foundation and runtime spine.

- 2026-06-26 E1.1/E1.2 proof path.
- 2026-06-27 maintenance audit.
- 2026-06-28 status refresh.
- 2026-06-29 tool-market integration and ICP correction.
- 2026-06-30 dashboard, Jarvis, and reliability boundaries.
- 2026-07-01 operator dashboard and coordination system.
- 2026-07-02 Jarvis MVP, CrewAI proof, and release consolidation.
- 2026-07-03 priority packets, E1.2 continuation, Vercel Jarvis, and hybrid RAG.

Key Traceback Wins

Provider Path Correction

The system corrected the provider path from a mistaken OpenAI assumption to the actual OpenRouter path before relying on the provider comparison. That protected the project from documenting a false runtime route.

Telegram Credential Boundary

The system surfaced and removed a Telegram-token-shaped tracked documentation issue. Future sends must use ignored env or approved external secret flow only.

Public-Safe Dashboard Claims

The dashboard and reports now distinguish:

- static/browser-local control surface;
- provider-disabled local or hosted API contract;
- future Railway always-on backend;
- future provider-backed execution;
- future writeback.

This prevents the project from claiming live automation before proof exists.

RAG Boundary

The RAG upgrade added hybrid behavior without weakening the approved-corpus scope. When vector execution was not available, fallback behavior stayed deterministic and auditable.

Current Transfer State

Ready for transfer:

- Founder notes are structured day by day.
- Current-state report exists as Markdown and PDF.
- Knowledge-system architecture is explicit.
- Jarvis modes are clear.
- Hybrid RAG is implemented with fallback and benchmark.

- Next action gates are known.

Next safe action:

Run one focused E1.7 readiness lane for Railway/provider-disabled always-on Jarvis, or one focused vector-readiness lane for local embedder/turbovec evaluation. Do not combine them unless the owner explicitly opens a broader execution block.

Useful Public Links And Artifacts

- Current hosted dashboard alias: <https://public-ruddy-nine-40.vercel.app>
- Project dashboard route: `/project/dashboard/`
- Jarvis health route: `/health`
- PRD/ICP lane route: `/api/lanes/prd-icp`
- Agent-orchestra lane route: `/api/lanes/agent-orchestra`
- Founder notes packet:
`project/runs/2026-07-03-daily-founder-notes/daily-founder-notes-packet.md`
